# Longest Substring with Same Letters after Replacement (hard)

### Problem Statement #

Given a string with lowercase letters only, if you are allowed to **replace no more than 'k' letters** with any letter, find the **length of the longest substring having the same letters** after replacement.

### Example 1:

```
Input: String="aabccbb", k=2
Output: 5
Explanation: Replace the two 'c' with 'b' to have a longest repeating substring "bbbbb".
```

### Example 2:

```
Input: String="abbcb", k=1
Output: 4
Explanation: Replace the 'c' with 'b' to have a longest repeating substring "bbbb".
```

### Example 3:

```
Input: String="abccde", k=1
Output: 3
Explanation: Replace the 'b' or 'd' with 'c' to have the longest repeating substring "ccc".
```

# Try it yourself #

```
○ C++
🍨 Java
           Python3
                         JS JS
 1 using namespace std;
                                                                                            3 #include <iostream>
 4 #include <string>
5 #include <unordered_map>
7 class CharacterReplacement {
    static int findLength(const string& str, int k) {
10
       int maxLength = 0;
       // TODO: Write your code here
11
12
       return maxLength;
13
     }
14 };
15
```

### Solution #

This problem follows the **Sliding Window** pattern and we can use a similar dynamic sliding window strategy as discussed in No-repeat Substring. We can use a HashMap to count the frequency of each letter.

We'll iterate through the string to add one letter at a time in the window. We'll also keep track of the count of the maximum repeating letter in any window (let's call it maxRepeatLetterCount). So at any time, we know that we can have a window which has one letter repeating maxRepeatLetterCount times, this means we should try to replace the remaining letters. If we have more than 'k' remaining letters, we should shrink the window as we are not allowed to replace more than 'k' letters.

### Code #

Here is what our algorithm will look like:

```
🕌 Java
             Python3
                            C++
                                        JS JS
 1
    using namespace std;
 2
                                                                                                   3 #include <iostream>
    #include <string>
 5
    #include <unordered map>
 6
 7 class CharacterReplacement {
 8
 9
      static int findLength(const string &str, int k) {
10
        int windowStart = 0, maxLength = 0, maxRepeatLetterCount = 0;
        unordered_map<char, int> letterFrequencyMap;
11
12
        // try to extend the range [windowStart, windowEnd]
13
         for (int windowEnd = 0; windowEnd < str.length(); windowEnd++) {</pre>
14
          char rightChar = str[windowEnd];
15
          letterFrequencyMap[rightChar]++;
          maxRepeatLetterCount = max(maxRepeatLetterCount, letterFrequencyMap[rightChar]);
16
17
18
          // current window size is from windowStart to windowEnd, overall we have a letter which is
19
          // repeating 'maxRepeatLetterCount' times, this means we can have a window which has one
20
          // letter repeating 'maxRepeatLetterCount' times and the remaining letters we should replace.
          // if the remaining letters are more than 'k', it is the time to shrink the window as we
21
22
           // are not allowed to replace more than 'k' letters
          if (windowEnd - windowStart + 1 - maxRepeatLetterCount > k) {
23
24
            char leftChar = str[windowStart];
25
            letterFrequencyMap[leftChar]--;
26
            windowStart++;
27
28
29
          maxLength = max(maxLength, windowEnd - windowStart + 1);
30
31
32
        return maxLength;
33
      }
34
    };
35
36 int main(int argc, char *argv[]) {
      cout << CharacterReplacement::findLength("aabccbb", 2) << endl;</pre>
37
      cout << CharacterReplacement::findLength("abbcb", 1) << endl;</pre>
38
      cout << CharacterReplacement::findLength("abccde", 1) << endl;</pre>
39
40
41
                                                                                          Output
                                                                                                 2.191s
 5
 4
 3
```

### Time Complexity #

The time complexity of the above algorithm will be O(N) where 'N' is the number of letters in the input string.

## Space Complexity #

As we are expecting only the lower case letters in the input string, we can conclude that the space complexity will be O(26), to store each letter's frequency in the **HashMap**, which is asymptotically equal to O(1).
